## PRECARIOUS WORK RESEARCH (PWR)

## PRELIMINARY RESULTS

You shared your experiences with precarious employment, its impacts on your health and well-being, and the COVID-19 pandemic. Below are some findings from our survey and in-depth interviews.

**SURVEY RESULTS** 

We conducted a survey of over 400 precarious workers aged 25-55 years across Ontario.

## **INTERVIEW RESULTS**

We conducted 40 in-depth interviews among a sub-sample of those

surveyed and learned more about their experiences.

The reasons participants gave for entering into precarious employment were constraints of labour market opportunities and conditions, needing to balance work with family (including caregiving obligations), and needing money to support a family.

Participants described constant stress due to lack of access to employer-based benefits and employer abuses of power that kept them in unsafe and uncertain working conditions.

Precarious workers used coping strategies, including drawing on savings, seeking out social support from social circles, relying on or generating resilience, modifying their perspectives or attitudes toward the hardships, and self-care strategies including physical activity.

The COVID-19 pandemic intensified precarity and its impacts on health and well-being of workers' and families. The pandemic also caused an increased need for additional social and health supports and services, while decreasing access to them.

Precarious workers identified numerous employment, health, and social policies, as being essential for improving their employment conditions and supporting their well-being along with that of their families. These policies include adequate paid sick days, and affordable and comprehensive health benefits including dental, ophthalmological, and mental health services.
